

High-tech Mileage Maker Promises Fifteen to Thirty Percent Fuel Economy Improvement For All Gas and Diesel Vehicles

Strategx Marketing LLC unveils revolutionary fuel economy breakthrough. The MPG Booster Disc utilizes sophisticated, Quantum Physics, to improve fuel atomization and reduce harmful emissions by augmenting the molecular composition of fossil fuels in all combustion engines.

Montana ([PRWEB](#)) January 3, 2005 -- Small but mighty, the patented quarter sized disc adheres to the outside of your fuel tank where it emits a "Wave frequency" into your gas or diesel fuel. The frequency breaks up fuel molecules inside the tank making them smaller to create superior fuel combustion. This "Wave Frequency Process" or (WFP) as it is known equates to substantial reductions in exhaust emissions and notable mileage improvements for passenger and recreational vehicles as well as, fuel consumption improvements for all types of agricultural and heavy equipment.

"Much the same way a microwave sends invisible waves into food to change its molecular composition from frozen to piping hot, the MPG Disc, sends a wave frequency into your gas or diesel tank where it increases the number of fuel molecules for improved combustion" explains Allan Shepard Owner of Strategx Marketing, national distribution company for the MPG Booster Disc.

When asked to simplify what it means for the average consumer like me, Shepard enthusiastically answered, "It gives everyone a tool to fight back out of control fuel prices." He went on to say, "The Disc will convert even the biggest gas guzzling SUV into a mileage conscious daily driver with increases of up to five additional miles per gallon. It even works on farming and heavy equipment."

According to marketing officials, because the MPG Booster Disc will in NO WAY void any vehicle warranty, is affordably priced, adheres in place in under two minutes, and works with any combustion engine, they expect it to have massive market appeal. Pre-launch sales of the Disc have been extraordinary and as the Company's national advertising launch date nears, (15, January 2005) they anticipate very high demand and pledge their readiness.
