

Hamilton Safe Launches Next Generation of Drive-Up System

New model combines quiet operation, integrated air power motor package, and weather-resistant exterior.

Cincinnati ([PRWEB](#)) January 05, 2015 -- Hamilton Safe, a national leader in drive-up tube systems, has combined the best features of two successful drive-up systems in a new model, the HA1000-XLR. Hamilton Safe chose to upgrade the previous HA-45 and HA1000 drive-up system models with a system that would enhance the usability and durability of both, optimized for use in banking, pharmaceutical and retail applications. The stainless steel system integrates improved functionality including an integrated air power motor package and dual user input locations in a sleek and weather-resistant exterior.

The HA1000-XLR will offer customers integrated audio with microphone, speaker, and call of service with an optional video mounting, one-way and two-way video. The system also offers dual user input for consumers in various sized vehicles. As organizations look to shrink their physical footprint, the HA1000-XLR offers a smaller footprint for fitting in tight spaces and small islands.

One of the largest physical security manufacturers in the United States, Hamilton Safe's HA1000-XLR is available in both upsend and downsend. Integrated audio and a new integrated air power motor package provide easy service access, quiet operation for improved communication, and reduce down time.

Notably, the HA1000-XLR's stainless steel and composite exterior resists rusting, chipping and fading, with an optional extreme weather upgrade providing increased corrosion resistance.

"Our goal was to streamline our two most popular drive-up systems, the HA1000 and the HA-45. Our result, the HA1000-XLR, is the perfect hybrid of the two legendary models, combining the best of both into one footprint," said John Haining, president of Hamilton Safe.
