

New load securing system for semi trailers

([PRWEB](#)) December 1, 2002 -- Looking for Investors. Will be manufacturing flatbed and dropdeck trailers for semi trucks Ours will differ from all the rest on the market with our new load securing system. All that are on the market at the moment that have a winch for tightening the straps, that secure the load, are manually tightened. In other words you need to put a round steel bar into the winches and pull the strap tight by hand. This method is very dangerous for driver. Many times the bar has slipped and injured the driver. Ours will be powered hyd pumps that will turn winches with hyd motors. When proper tension is obtained the settings will be saved on each individual strap. If the strap should become loose because of load compression or load shifting, the straps will automatic tighten back to tension settings. This will keep load tight and prevent losing the load as driver goes down the road. (Patents have been applied for)
