RVS Takes Driver Management to A Higher Level

Route Vision Systems adds imaging technology to delivery, merchandising and DSD applicaitions to record vehicle events. Accidents, service requests, property damage, non-reportable damage.

(PRWEB) January 26, 2003 -- Seattle based Route Vision System, RVS, announces the release of Accident Track ©, the worlds first independent imaging based driver management module. Accident Track is a stand-alone product capable of running on most CE 3.0/Pocket PC and CE.Net, Portable devices. However, Accident Track's real value shines through when installed on imaging based devices produced by Handheld Products, (HHP) or Intermec.

Accident Track is the first information gathering system that allows fleet drivers, sales representatives or merchandisers to record and document vehicle events while in the field, at the time it occurs, prior to returning to the home facility. It specifically tracks accident reporting or damage, vehicle inspection and service request. In real time systems this information is downloaded directly to the Supervisor or Human Resource contact for immediate damage control. In batch applications it is downloaded as soon as the driver returns to the home facility.

Accident Track logically addresses Driver Management. Are your vehicle inspections not completed or timely? Accident Track prompts the driver for inspections based on company requirements. Inspections are verified either through the trust system or through the use of key point Bar Code Identifiers located at points on the vehicle. As a driver do you require service to your vehicle? Accident track files service request's directly from the portable device. Great for out of town field representatives.

I've just been in an accident, what do I do? Accident Track walks you through logical steps to gather the required information. This includes when installed on an imaging device the photographic documentation of vehicle damage and property damage. Accident reports are categorized by reportable and non-reportable events. This single function allows you to control your liability, accurately report the event and contain insurance costs!

When combined with a full integration solution including RVS Geotab GPS system. Driver management is greatly enhanced. This system allows you to directly compare driver activity to driver events. No other system addresses the needs of your organization to control and reduce insurance cost in this manner. Eliminate bad driver habits, dramatically increase safety levels, reduce or eliminate accidents and lower internal costs.

Accident Track runs independently of other applications so it does not interfere with your delivery application. Accident track is available both in MSDB or MSSQL for small or large applications. Accident Track is just one part of RVS Driver Management solutions, which include Houndware Fleet Maintenance and Assets Module, Geotab GPS Driver Exception Module and Accident Track. For more information contact your RVS reseller.

Route Vision Systems leads the nation in Imaging Based solutions holding three copyrights in imaging applications. Its suite of products and solutions in development cover a broad spectrum of applications aimed at the producer distributor and distributor customer.
