SAN DIEGO ([PRWEB](#)) March 04, 2021 -- Global Cloud Fleet, a leading solution provider for vehicle telematics, announced today the release of their new AI powered video solution that effortlessly combines dual-facing video with cutting edge telematics.

The VS800 Video Solution seamlessly pairs with Global Cloud Fleet's EZ750 telematics gateway, optimizing GPS fleet tracking. The video camera utilizes edge processing to identify "critical events", events that are most important to fleet managers, and then brings high quality video footage of that event from both the road view and cabin view.

Along with that, the video solution provides real-time notifications as well as in-cab driver alerts of these critical events. Both features offer innovative solutions to widespread fleet management and overall driver safety.

The team showcased its dedication towards optimizing its product's performance while keeping its cost below much of the market's comparable solutions.

"Edge processing, which is identifying and uploading only events that are of interest, is the future for all video solutions. What Global Cloud Fleet has done is put this technology into a cost effective package and made it affordable for everyone," says Greg Jones, COO of Global Cloud Fleet.

The VS800 Video Solution can be purchased as a complete package or as an upgrade to the EZ750 gateway, allowing a flexible deployment capability that many other solutions cannot offer.
